

## Inspection

Before mounting tires, air valves and TPMS on the wheels, it is essential to implement the following.

- Inspect the wheels immediately upon receipt and before mounting tires. Confirm the wheels have the correct specification, wheel finish, hardware color, air valve color, PCD, center bore diameter, also roundness.
- For roundness checking, it must be conducted without other parts being installed on the wheel, such as air valves, TPMS and metal counterweight. We do full inspection about wheel roundness during QC process to ensure all wheels meet our standard before they leaves our facility.
- Once tires have been mounted, everything related to wheel roundness will NOT be covered by warranty.
